

2016

Farm Record Analysis

Closeout

Procedures

January 4, 2017

Introduction

This manual was developed to assist in the standardization of data collection and entry for Farm Business Management Annual Analysis Reporting. Consistency in the data entry is the key to creating a useable set of benchmark for producers. **Blue text indicates current year additions/revisions.**

Acknowledgements

Farm Business Management Instructors at Northland Community and Technical College developed this manual during the Fall of 1996. Updated annually by the Center for Farm Financial Management, University of Minnesota in consultation with Minnesota Farm Business Management, Minnesota State Colleges and Universities.

This manual was partially funded by a National Farm Business Management and Benchmarking Grant from the USDA National Institute of Food and Agriculture.

I.

Timelines

Key Dates

- January-Early March 2016 – FINAN Completions
- March 1, 2017 – Red River Valley Files need to be completed
- March 2, 2017 – Red River Valley Database Review in Moorhead
- March 6, 2017 – All other files due to be included in state database
- March 8, 2017 – Regional Database review meeting, Mankato, Southern report group
- March 9, 2017 – Regional Database review meetings, St. Cloud and Thief River Falls, Northern report groups
- March 14-15, 2017 – State Database Review, St. Paul
- March 16-22, 2017 – Annual Reports created
- March 23, 2017 – PDF of reports made available to instructors
- March 30, 2017 – Printed reports available for distribution

II.

2016 Overview

What's New?

- “Summary Group” has been added to the Summary Information page of FINAN. This will determine which Annual Report the farm is included in.
- Data entry pages for CCC Government Crop Loans have been removed from the Balance Sheet and FINAN. CCC crop loans should be entered as Current Loans, with the crop included in Crop Inventory.
- Sugar beet enterprise analysis in cases where processors did not accept all sugar beets produced:
 - Acres: Include all acres planted
 - Total production: Include only the quantity harvested/delivered.
- Cow-calf enterprises should include the costs of growing calves to normal “calf” sales weight
 - Calves held beyond normal calf sales weight should be transferred to a grow/finish enterprise OR should be coded with the “Cow-calf with backgrounding” special sort
 - Cow-calf enterprises with an average sales weight greater than 800 pounds will be deleted unless the above special sort is selected or a Unique Situation report indicates that the producer normally weans calves at greater than 800 pounds

Points of Emphasis for 2016

- Review and correct all *Net Worth Discrepancies*. Farms with *Net Worth Discrepancies* greater than 1% of gross revenue will be deleted from the database.
- Include both quantity and value for all *Feed Fed*.
- Review livestock enterprise reports and correct obvious errors in feed efficiencies and other efficiency factors.
- Continue to tag Organic, Organic Transition, Specialty Crop, MDA Beginning Farmer Scholarships, and Veterans in whole farm special sorts.
- Combine Dairy and Dairy Replacements where appropriate.
- **Review special sorts and crop production practices and make changes where appropriate.**

State Database Thresholds

Whole Farm Analysis

- Cash check discrepancy should be < 1% of gross income and < \$5,000.
- Liabilities check discrepancy should be < \$300.
- Net worth discrepancies should be <1% of gross income and <\$5,000.
- All farms, except pass-through entities, must include deferred liabilities. If a farm has negative deferred liabilities, enter zero and include a Unique Situation report to your database reviewer.
- All farms must include both cost and market balance sheets.
- Total machinery and building depreciation should be ≤ 0 . See Capital Sales and Purchases for handling gain on the sale of capital assets.
- All farms must include estimated labor hours. Even though FINPACK says this is optional, it is not optional for us.
- Personal property taxes should not be entered for Minnesota farms.
- Average Hired Labor Rate per Hour should be between \$5 and \$75.
- Whole farm expenses should be \geq zero. If a farm has legitimate negative whole farm expenses, submit a Unique Situation report to your database reviewer.

Crop Enterprises

- Cover crops for hay establishment (oats) should not be coded with a Double Crop type.
- Irrigation expense should not be allocated to non-irrigated crops.
- For hay crops, seed expense should only be entered on hay establishment enterprises and not on normal production enterprises unless there were re-establishment costs. See Crop Type on page 40.
- Rent expense should be > 0 on cash rented crops. If legitimate, enter as share rental with 100% share or delete the enterprise from the database.
- Real estate taxes should be > 0 on owned land.
- Seed expense should be > 0 on corn, soybeans and other common commodity crops.
- Seed expense should = 0 for canning crops such as peas and sweet corn.
- Drying should = 0 on forage crops. Enter preservatives as Misc. Crop Expense.
- Expenses should be ≥ 0 . Negative overhead expenses are caused by over-allocating direct expenses for labor, leases, utilities and custom hire.
- ARC and PLC payments must be allocated to the cropping enterprises. For producers who did not participate, include a Unique Situation report for your analysis coordinator.
- ARC and PLC payments must not be allocated to ineligible vegetables or edible beans.

Livestock Enterprises

- Beef calves from a cow-calf enterprise should be sold at normal calf selling weight or transferred to a grow/finish enterprise. Enterprises with an average sales weight greater than 800 pounds will be deleted unless the “Cow-calf with backgrounding” special sort is selected.

- Carefully review all items in the Other Information results, such as Calving Percentage, Feed Conversion, etc.
- Enter feed quantities in the proper unit, e.g., do not enter Protein in pounds.

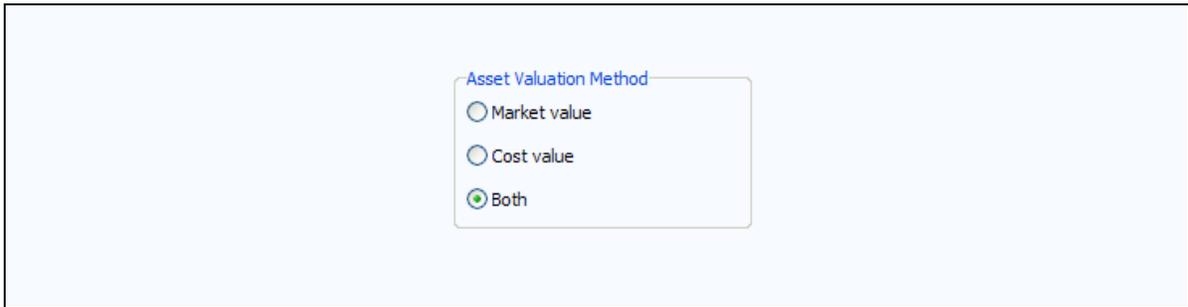

FINPACK Setup

- Download the program setup for your group (even if you did this last year) from <http://www.cffm.umn.edu/Downloads/SetFiles/default.aspx>.

III.

*Balance
Sheet*

Entering Data on the FINPACK Balance Sheet

Asset Valuation Method

Market value

Cost value

Both

Valuation Method:

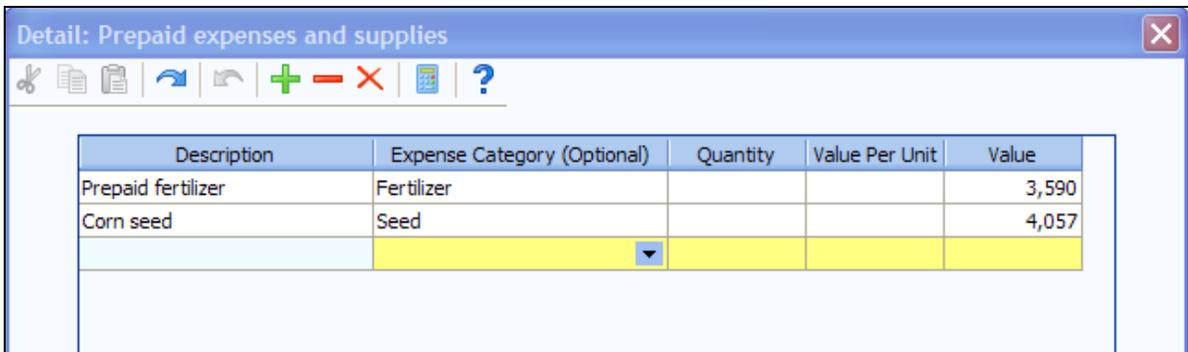

Select “Both” during entry; you can still choose to print only the Market Value or Cost Value by selecting these later when you print.

ASSETS:

Current Farm Assets:

Cash and Checking Balance:

Includes all farm accounts, savings and checking, CD’s (Certificates of Deposit), money market accounts, etc. Use **Detail** to make a detailed list.

Description	Expense Category (Optional)	Quantity	Value Per Unit	Value
Prepaid fertilizer	Fertilizer			3,590
Corn seed	Seed			4,057

Prepaid Expense and Supplies:

Include paid fuel, fertilizer and chemical in tanks, fall applied fertilizer and/or chemicals, prepaid accounts at elevators, co-ops, companies, etc. Use **Detail** to select the expense category to help identify the total expense incurred in the FINAN enterprise analysis.

Growing Crops:

Example: Winter Wheat (cost of inputs). Use **Detail** to select the expense category.

Accounts Receivable:

Examples: Insurance payments, money owed from others, etc; estimated Disaster payments to be received

next year, LDP'S where paperwork is done but the check is not received (corn silage). The beginning balance sheet should include the gross value of the previous December milk which was received in January. The ending balance sheet should include the December check which will be received in the following the January. Deferred crop sales may be included in Accounts Receivable or as crop inventory. Use **Detail** in the entry box to enter a detailed list.

Loan repayment rate locks: If the producer has a marketing loan repayment rate lock in place as of January 1 and the market price is higher than the repayment rate, show the equity gain as an account receivable.

Projected ARC or PLC payments should not be included until the Marketing Year Price has been established.

Hedging Accounts:

Enter the amount of equity that could be withdrawn if the position were settled on the statement date. Some brokerage statements list this as "**Net Liquidity.**"

Other Current Assets:

Enter any item not fitting the categories listed in the Current Assets section of the Balance Sheet.

Crops:

Always enter the Quantity, Value/Unit and Value. **Enter crops under CCC loan as normal crop inventory, valued at market value or loan rate, whichever is higher.** If the market price is below the loan rate and an LDP has not been claimed, value the crop at local loan rate. If the inventory is "priced" or under contract, use the contract price less estimated expenses for storage and delivery.

Market Livestock:

Include feeder animals intended for eventual sale. Youngstock intended to eventually enter the breeding herd should be included in Breeding Livestock.

Intermediate Farm Assets:

Breeding Livestock:

Include all breeding females and males including youngstock and replacements. To-be-culled breeding animals remain as intermediate livestock until sold. Cost value for raised livestock should be set initially as the estimated cost of production (base value) and should remain the same throughout the life of the animal. Purchased animals should be separated from raised if they represent over 10% of the herd with cost value of the purchase cost less depreciation down to the base value.

Farm Machinery and Equipment:

Enter both the Market Value and the Cost Value. For cost valuation, use an economic depreciation method that reflects the estimated actual useful life of the asset or group of assets. An easy calculation is to subtract 10 to 15% of the remaining cost value each year. Start new machinery at full purchase cost for both cost and market value and depreciate depending on use during the year. For new students, establish the cost value by creating a detailed list and estimating the purchase cost less economic depreciation on each item. If this is unworkable, begin at market and apply economic depreciation in future years. See Entering Capital Leases on the Balance Sheet for leased assets. Use the **Detail** to enter a detailed list. Use the Adjust Values (%) feature to do percentage depreciation on the detail list (see below).

Depreciation percent... Adjust market values
 Adjust cost values

10.00

Adjust?	Description	Cost Value	Adjusted Cost Value	Market Value	Adjusted Market Value
<input checked="" type="checkbox"/>	Flatbed trailer	782	704	1,116	1,116

<input checked="" type="checkbox"/>	Foam marker	401	360	558	558
<input checked="" type="checkbox"/>	Tire changer	304	275	465	465
Total		86,514	77,863	105,109	105,109

Suggested Depreciation Rates

Livestock equipment	15 - 20 %
Crop machinery	7- 15 %
Buildings and bins	5 %
Augers and movable equipment	10 %
Vehicles	10 – 20 %
Office Equipment	30 %

Suggested Depreciation Percentages Based on Asset Useful Life

Years	Depreciation %	Years	Depreciation %
2	50	9	11
3	33	10	10
4	25	11	9
5	20	12	8
6	17	15	7
7	14	20	5
8	12	25	4

Titled Vehicles: If desired, separate titled vehicles from farm machinery.

Other Intermediate Assets: Example: Cooperative Stock, (this is not to be confused with co-op patronage equities which are long term assets), Beet Stock, Farm Credit Services Stock, Wheat Growers Stock. Enter the retained value for each cooperative separately. For the market column, value stock at market value with recognition of changes if significant changes in valuation have occurred since the beginning of the year. Also include the remaining value yet to be expensed on investments in perennial crops. Use **Detail** to enter a detailed list.

Long Term Farm Assets:

Farm Land: Use **Detail** to enter the Acres, Value/Acre, Cost Value and Market Value. Do not change the Market Value unless a significant change occurs.

Farm Buildings: Enter both Cost Value and Market Value. Use a Management Depreciation Method which depreciates the original cost over the life of the asset for the cost value. An easy calculation is to subtract 5 to 7% of the remaining cost value each year. Enter new buildings at original purchase cost for both cost and market value and depreciate based on use during the year. See Entering Capital Leases on the Balance Sheet for leased assets. Use the **Detail** to enter a detailed list.

Note: For the same farm, you can separate land and buildings on the “Cost” Balance Sheet, yet lump them together on the “Market” Balance Sheet.

Other Long Term Farm Assets: Enter any long term asset not already categorized above, both Cost and Market Value. Example: Co-op equities.

Personal Assets:

These should be detailed as well. Enter the house in this category. The loan should follow the purpose of the loan not necessarily the collateral. A home improvement would be a personal loan. A loan for farming with the house as collateral would be a farm loan.

LIABILITIES:

Accounts Payable and
Other Accrued Expense:

Usually includes accounts payable, charge account, such as feed, fertilizer owed to local businesses, real estate taxes owed but not paid. Include any government payments received before the beginning balance sheet date but belonging to next year's crop. Do not include credit card or FarmPlan balances if expenses are included in outflows—include in current notes instead. Use detail to list each account and the Expense Category.

Description	Expense Category (Optional)	Amount
Sweet Feed Company	Purchased feed	2,032
Farmer's Coop - fuel	Fuel & oil	
Zumchester Repair - parts	Repairs	0

Current Loans:

List loans due in less than 1 year. If expenses financed by credit cards or FarmPlan are included as cash outflows in FINAN, list the balance as a Current Loan here. If not, include them in Accounts Payable.

Intermediate:

List loans owed on equipment and livestock; usually ten years or less. P&I payment is required for calculation of Term Debt Coverage. Principal due is amount due in the next 12-month period. (FSA setaside payments should be listed as separate loans without accrued interest or payments, 0% interest.)

Capital Leases

If this is an operating lease (the operator's intent is not to eventually own the asset), do not enter the asset or liability on the Balance Sheet.

If this is a capital lease, which includes a "buy-out" provision:

- 1) Report the asset value in the appropriate asset category and depreciate on the cost balance sheet as discussed at the end of this section.

- 2) Report the lease as a liability with interest and a payment separated by principal and interest.
- 3) Use the example at the end of this section to help in the calculation of principal and interest.

Long-Term Liabilities:

List loan with an original term of longer than ten years ~ usually real estate (land or buildings). P&I payment is required for calculation of Term Debt Coverage. (FSA setaside payments should be listed as separate loans without accrued interest, or payments, 0% interest.)

Personal Liabilities:

Income and self-employment taxes payable should be estimated and included as personal income taxes payable. Be sure to enter on both the beginning and ending Balance Sheets. List credit cards as accounts payable if they are not included as cash outflows in FINAN.

Current Personal Loans:

Short term loans due 12 months or less. Include credit card balances if included in cash outflows in FINAN.

Intermediate Personal Loans:

Car loans, boats, furniture and other personal items.

Long Term Personal Loans:

Real estate, house, cabin, trailer house.

Deferred Liabilities:

Deferred liabilities must be included for all farms except “pass-through entities,” LLCs and S Corporations for which income is passed through to the owner for tax purposes. Use the detail feature to calculate deferred liabilities on the Market Balance Sheet. Deferred Liabilities include:

	Amount
Deferred taxes on current inventories	23,428
Deferred liabilities on capital assets	59,342
Total	82,770

- 1) Taxes due on current inventories (grain, market livestock, etc.) include both income and self

employment taxes. Enter the cost basis of purchased feeder as well as the amount of CCC loans treated as income and already taxed.

Description	Sign	Value
Market value of current inventories		105,299
Payables and accrued expenses	(-)	3,883
Purchase cost of feeder livestock	(-)	17,745
Government crop loans already taxed	(-)	
NOL carryovers and other adjustments	(-)	
Taxable current inventory value	(=)	83,671
Estimated marginal tax rate (%)	(*)	28.00
Deferred taxes on current inventories	(=)	23,428

- 2) Taxes due on the gain from capital assets (land, stock, machinery, etc.) typically includes capital gains tax calculated on the difference between market value and the tax basis value. In accordance with the Farm Financial Standards, selling costs should have already been subtracted from the market value of assets and therefore should not be included here.
- 3) FINPACK defaults the cost values from the balance sheet into the tax basis column. To be accurate, you should enter the actual tax basis for each asset category. FINPACK will automatically update the tax basis using the cost values until you change them so they do not match. After you change the tax basis, you must continue to update it from year to year.
- 4) The chart on the following pages should be used in determining the appropriate tax rate to apply to the assets.

Detail: Deferred liabilities on capital assets ✖

Entering Capital Leases on the Balance Sheet

The first step is to determine if the lease is a capital lease, or simply a rental arrangement. The Farm Financial Standards Council (FFSC) Guidelines, Appendix G, states,

According to GAAP, a lessee should show the lease as a capital lease if the lease is non-cancelable and meets any one of the following four interest tests:

- 1. The terms of the lease transfer ownership of the property to the lessee at the end of the lease term.*
- 2. The lease contains a bargain purchase option.*
- 3. The term of the lease is at least 75% of the estimated economic life of the leased property.*
- 4. The present value of the minimum lease payments equals or exceeds 90% of the fair market value of the leased property.*

If the lease is determined to be a capital lease, then, for financial statement purposes, the lease payments must be capitalized and amortized over the term of the lease. It must be remembered that it is the lease investment, which is being put on the balance sheet, not the asset being leased.

Treatment of capital leases is a complicated subject that is often treated incorrectly. Most farmers leasing capital assets under a capital lease probably treat a capital lease like a regular lease by deducting the entire payment as a business expense. Although simple, this is incorrect according to both GAAP and the IRS. Since our purpose is a management application, we will follow the GAAP (and FFSC) format and leave the tax implications to the tax practitioners.

Since a capital lease is actually a type of purchase agreement, many lenders prefer to see the asset, and the accompanying liability, on the balance sheet. This requires the use of a present value chart (or a business calculator) to separate the payments into an interest portion and a principal amount, and an amortization calculation to further separate the principal portion into current and term debt. This is what both GAAP and FFSC recommend.

The asset value (the value of the lease entered on the balance sheet) consists of the current year payment made in advance plus the capitalized value of the outstanding principal portion of future payments based upon the effective interest rate as determined through the use of a present value table or business calculator. This value may be amortized over the estimated life of the asset being leased, or may be amortized over the life of the lease.

The liability entered on the balance sheet is the capitalized value of the principal portion of future payments based upon the effective interest rate, as determined using a present value table or a business calculator. This liability is further divided into current and non-current portions. Accrued interest is also entered as a current liability.

Example:

An asset costing \$50,000 is purchased utilizing a five-year capital lease, based on an interest rate of 10%.

Option #1: There are five equal installments (lease payments) of \$11,990.80 each. The first payment is due upon delivery and is entirely principal. The remaining four payments consist of both principal and interest. Using a present value table, we find that the factor for the four future payments at 10% interest is 3.1699 (*see Present Value Table, page 25*). So, the calculation of the value of the asset the first year (prior to amortization/depreciation) is:

$$\text{Initial payment} + \text{capitalized value of future payments, or} \\ \$11,990.80 + (11,990.80 \times 3.1699 [n=4]) = 11,990.80 + 38,009.64 = 50,000.44$$

Other than proving the process, this calculation would not be necessary if you know the actual value being leased. However, the value being leased may differ from the asset cost if there is a buy-out or asset value remaining at the end of the lease term. It is essential that the balance sheet reflect only the value being leased (*which is not necessarily full the value of the item being leased*) and the liability against that value. This asset value would be amortized (depreciated) over the estimated life of the asset, or over the term of the lease. Using a five-year term, the balance sheet value each year would be:

<u>Year</u>	<u>Amortization</u>	<u>Value</u>	
19x0	0	50,000	If, as is likely, the lease was initiated during the year (rather than on January 1), a monthly convention would be used in calculating the amortization (depreciation) schedule. For example, if the lease was initiated on April 1, the first year amortization would be \$7,500 and the sixth year would be the remaining \$2,500.
19x1	10,000	40,000	
19x2	10,000	30,000	
19x3	10,000	20,000	
19x4	10,000	10,000	
19x5	10,000	0	

On the liability side, the capitalized value of the lease liability is amortized over the remaining life of the lease. The capitalized value of the future payments, utilizing a present value table or business calculator would be:

$$\$11,990.80 \times 3.1699 [n=4] = \$38,009.64$$

This amount will be amortized over the remaining four annual payments using a standard interest-principal calculation.

<u>Year</u>	<u>Bgn Balance</u>	<u>Payment</u>	<u>Interest</u>	<u>Principal</u>	<u>End Balance</u>
19x1	38,010	11,991	3,801	8,190	29,820
19x2	29,820	11,991	2982	9,009	20,811
19x3	20,811	11,991	2081	9,910	10,901
19x4	10,901	11,991	1090	10,901	0

The 19x1 balance sheet would show the total principal liability (\$38,010) divided between a current liability of \$8,190 and a non-current liability of \$29,820. The same procedure would be followed in subsequent years. Accrued interest on the lease is also listed as a current liability. The accrued interest is calculated on the entire principal liability adjusted to reflect the months between the lease payment date and the end of the period represented by the balance sheet.

Since the asset value of the lease is actually the value of the lease, and not the value of the leased asset, any remaining end-of-lease buyout value is *not* reported as an asset on the balance sheet. Similarly, the buy-out price is not reported as a liability. These values, if the buy out is performed, will be entered at the time of that purchase, when the lease is finished.

Other Lease Options (using the same \$50,000 asset and 10% interest rate):

Option #2. There is no initial payment upon delivery. The first payment is not due until the end of the first year, and there are a total of five annual payments of \$13,189.83 each. AN@ on the present value chart, the number of outstanding payments, would be A5@. The interest rate is 10%. Compared to option #1, the higher annual payment of \$13,189.83 reflects inclusion of the first year=s interest to the lease. The proof: $\$13,189.83 \times 3.7908 [n=5] = \$50,000.01$.

Option #3. If an asset is leased/purchased with the purchaser unaware of the purchase price and/or the interest rate; use the annual payment, the number of payments, and an imputed interest rate to determine the capitalized value of the lease and the outstanding liability.

Option #4. Suppose there are unequal lease payments. The lessee makes an initial (on-delivery) payment of \$6,000, a low \$7,500 payment at the end of the first year, and three more annual payments of \$16,007.42.

- a. Add the 4 remaining payments:
 $7,500 + 16,007.42 + 16,007.42 + 16,007.42 = 55,522.26$
- b. $55,522.26$ divided by $4 = 13,880.57$ (average payment)
- c. $13,880.57$ multiplied by $3.1699 [n=4] = 44,000$ (outstanding principal)
- d. $44,000 + 6,000 = 50,000$ (total asset cost)

Option #5. An asset is leased with an initial payment (upon delivery) of \$11,391.16 and four more annual payments of 11,391.16. At the end of the fifth year the asset can be purchased for a buy-out price of \$2,750

- a. First calculate the remaining value of the asset. It is actually \$2,500 ($2,750 - 250$ interest = 2,500 remaining principal)
- b. $11,391.16$ (annual payment) $\times 3.1699$ [$n=4$] = 36,108.84 (remaining liability)
- c. $36,108.84 + 11,391.16$ (initial principal payment) = 47,500
- d. 47,500 (lease value) + 2,500 (remaining asset value) = 50,000 (total asset value)
- e. In this case, only the 47,500 (lease value) would be amortized/depreciated as an asset value and only 36,108.84 would be amortized as a liability on the balance sheet. The buy-out value of the asset would not be shown until it was actually purchased.

If you are setting up a new balance sheet during the term of an on-going capital lease, use the annual payment, the (actual or imputed) interest rate and the number of remaining payments to determine the capitalized asset and liability values remaining. In most cases, understanding the rationale is more difficult than actually performing the calculations.

Importance of Procedure:

The rationale behind standards, such as the FFSC ratios is the ability to compare an individual farm with a database. However, standardized calculations are worthless if the input data does not also conform to a standard reporting procedure. The decision to correctly include the capital lease value and liability on the balance sheet (rather than simply treating the lease payment as an annual operating expense) impacts thirteen of the sixteen FFSC ratios:

Current Ratio, Working Capital, Debt to Asset Ratio, Equity to Asset Ratio, Debt to Equity Ratio, Return on Assets, Return on Equity, Term Debt Coverage Ratio,
Asset Turnover Rate and all four Operational Ratios.

Reporting capital lease payments correctly in their component parts of interest and principal, rather than as a single operating expense (lease payment) will impact the remaining three financial ratios; Operating Profit Margin, Net Farm Income, and Capital Replacement and Term Debt Repayment Margin.

In management, being able to make consistent and accurate comparisons is important. Admittedly, one can compare with one's own trends over the years using non-standard measures or non-standard data to calculate these measures. However, in these times of narrow margins it is increasingly important that producers be able to compare their performance not only with themselves, but with that of their competition as well. Following standardized procedures is the key to reliability, consistency and accuracy.

Present Value Table:

An abbreviated present value table for interest rates between 5% and 15% and lease terms between 2 years and 15 years is provided on the following page. More extensive tables can be found in accounting texts, or other sources.

Present Value Table

N	5%	6%	7%	8%	9%	10%	11%	12%	13%	14%	15%
2	1.8594	1.8344	1.8080	1.7833	1.7591	1.7355	1.7125	1.6901	1.6681	1.6467	1.6257

*Finan
Instructions*

INPUT INSTRUCTIONS FOR FINAN

CREATING A NEW FINAN

In all areas where you wish to detail, use the **Details button or double click in the entry box** to do so. Many times it is helpful. Black numbers indicate no detail, blue indicates detail.

Data File Name: Use a unique file name. Remember, when a member of the database review team calls with a data problem you need to be able to identify the farm by this name.

The analysis name must be entered on this screen. It can be changed on the “File Navigator” screen if need be later. Recommendation: 2xxx Analysis

If possible, copy a previous year’s analysis and check “Clear out general data and prepare for another year.” All data will be deleted except:

- General Information and Summary Information pages remain unchanged. The Balance Sheets from last year remain selected; you need to select the appropriate Balance Sheets for this year.
- All detail values are deleted but the descriptions remain.
- Value of Labor and Management remains (Other Information page).
- Labor hours remain.
- Related Operating Expense Allocations to Crops, Livestock, and Other Enterprises remain.
- Crop names, descriptions, and acres stay in the Crop Enterprise Analysis.
- The Default Allocations stay in the Allocated Crop Expenses. Changes for interest allocation for sugar beet stock also remain and need to be changed.
- Livestock names and descriptions remain.
- Individual feed items remain, but quantities and dollars are cleared.

- The Default Allocations stay in the Allocated Livestock Expenses.
- Other Livestock Information such as; average number of head, normal total gain per head, barn capacity, or number of litters remain.

If Special Sorts (whole farm, crop, or livestock) were included, a dialog box will appear with the option to keep them or clear all special sorts. **If special sorts are retained, be sure to review them as data is entered and make changes where appropriate.**

GENERAL INFORMATION

Year of analysis	2012
Beginning balance sheet	December 31, 2011
Ending balance sheet	December 31, 2012
Cash flow plan for comparison (optional)	

Type Of Analysis

Whole Farm

Whole Farm with Enterprise Analysis

Show group summary information

Analysis complete, include in Portfolio Risk Analyst

- 1) Enter analysis year.
- 2) Select “Whole Farm with Enterprise Analysis”
- 3) Check “Show group summary information”
- 4) When you have completed the analysis, check “Analysis complete, include in RankEm.”

SUMMARY INFORMATION

- 1) Select proper type of business organization
- 2) Enter the producer’s unique Farm ID. Once established, the ID for a specific farm should never be changed. When a son or daughter takes over an existing farm and the parents exit or mostly exit management of the farm, a new farm ID should be assigned. If you do not know the correct ID, contact your regional or Center administration. This is necessary to keep unique ID#’s for the State Data Base.
- 3) State and County - Enter State and County name from pick lists
- 4) An operator is generally defined as one family that relies on the farm for family income and receives that income in the form of farm earnings (or owner wages in the case of a corporation). A husband and wife unit is generally considered one operator. Additional family members or partners are operators if they are not paid labor. It is possible to enter

decimals for part-time operators but unless the producer spends less than 50 percent of his/her time on the farm, the farm should have at least one operator.

- 5) All data is required by RankEm. Be sure to enter Acres Owned, Number of Operators to the tenth, Primary Operator Year of Birth and Years Farming.

Type of business	Sole proprietor	▼
Farm ID		12345678

Year started farming		0
Operator number 5		
Year born		0
Year started farming		0
Special sorts	None	...
Analyst Name	I. M. Analyst	
Summary Group	MN State College & University Red River Valley ▼	

- 6) Special Sorts: Identify organic farms, farms in organic transition, and specialty crop farms as well as farms that expanded or contracted during the year. A general guideline for use of the expansion or contraction is when there has been a 25% change in physical units of production or investment.
- 7) Analyst Name: Enter your name as the FINPACK user who prepared this analysis. Analyst Name will be displayed in RankEm to identify the analyst if there are questions or outliers which need correction. Analyst name will be deleted before data is uploaded to FINBIN.
- 8) Summary Group: Select the regional report group for this farm, MN State College & University North, South, Red River Valley or Southwest Minnesota Farm Business Management Association. All others choose “MN Other.”

CAPITAL PURCHASES AND SALES:

- 1) *Beginning Values and Ending Values* are displayed from the Balance Sheets. Enter capital purchase and sales.
- 2) *Enter Capital Purchases and Capital Sales.* For capital sales, always use **Detail** to enter the Balance Sheet Value of the asset sold. With this, FINAN will calculate the gain or loss on the sale.
- 3) Enter any assets repossessed under Capital Sales detail.
- 4) *Breeding Livestock* ~ Be careful that you do not double count capital sales. Enter sales here or in Cull Breeding under “Other Income.” Recommendation: Enter whole herd liquidations and major herd reductions here and enter normal cull sales under “Other Income”.
- 5) *Other Intermediate Assets* ~ Include sugar beet and corn processing stock purchases and sales. Be sure to include changes in PCA or FCS Stock as a purchase or sale as appropriate. Include sugarbeet unit retains (both sold and purchased). Enter any change in positive livestock ledger accounts from the beginning to the end of the year as a purchase or sale. Ledger “purchases” should also be added to livestock sales. Ledger “sales” should also be subtracted from livestock sales.
- 6) *Other Long Term Assets* ~ Be sure to include Patronage, stock redemption or retirement as a sale.
- 7) *Personal Capital Purchases and Sales*~ All purchases and sales of nonfarm capital assets should be listed in the proper category. Premiums on whole life insurance policies should be included in nonfarm capital purchases.
- 8) Recommended procedure for trade-ins
 - a) Enter only the “to-boot” amount as a capital purchase
 - b) Enter no capital sale
 - c) Cost value of the new asset equals the “to boot” paid plus the remaining cost value of the trade-in asset
 - d) Market value of the new asset equals the estimated current market value
 - e) Delete the trade-in asset from the machinery list

LIABILITIES:

- 1) *Beginning and Ending Principal Balances* are displayed from Balance sheets.

- 2) Enter *Money Borrowed and Principal Paid* for each loan.
- 3) Enter *Principal Forgiven* under Principal Paid **Detail**.
- 4) Enter *Accounts Payable Forgiven* under Accounts Payable Principal Paid **Detail**. This is the only entry allowed for Accounts Payable.
- 5) *Ledger Contracts*. Beginning and ending balances should be listed from the balance sheet if the balance is negative. Enter increases as money borrowed and decrease livestock income by the same amount. Enter decreases as principal paid and increase livestock income by the same amount.
- 6) *New Loans*. Enter loans taken this year as money borrowed.
- 7) Under each loan type or by individual loan, check liability balances as follows:

$$\text{Beginning Balance} + \text{Amount Borrowed} - \text{Principal Paid} = \text{Ending Balance}$$

FARM INCOME:

Crop Sales ~ Enter per crop; gross quantity of crop sold and gross income received. Enter gross proceeds here and enter expenses deducted from the sale as farm expenses. **Include gross sales of crops that were under CCC loan. Do not include money borrowed on CCC loans and treated as income for tax purposes.**

Livestock Sales ~ Enter number sold, total live weight pounds sold, and gross income received of market livestock. Enter gross proceeds here and enter expenses deducted from the sale as farm expenses. Record Cull Livestock in Cull Livestock section, not here. (To calculate live weight on grade and yield, divide the carcass weight by the yield, recommended yield 75%.)

For livestock sold on ledger contracts, increase or decrease cash sales by the change in the ledger balance. Show offsetting capital purchases, capital sales, borrowings or principal paid to balance cash flow.

Livestock Products ~ Enter gross quantity and gross income received.

OTHER INCOME:

Cull Breeding Stock ~ Enter income received from Cull Breeding Stock sales. Breeding stock sales should be entered as capital sales only when liquidating a herd or doing a major downsizing. Use Detail to allow Selecting the data into the Enterprise Analysis.

Miscellaneous Livestock Income ~ Enter any miscellaneous livestock income.

LDP Payments ~ Include all LDP Payments received during the Analysis Year.

Crop government payments ~ ARC and PLC payments present a special problem because the amount of the payment is not known until the end of the marketing year. This uncertainty makes it difficult or sometimes impossible to accurately match income to the production year. Therefore, it is recommended that ARC/PLC payments be recognized as income in the year received rather than trying to estimate the amount that should accrue to each production year.

CRP Payments ~ Enter all cash CRP Payments received in the analysis period.

Livestock Govt Payments ~ Include dairy MPP payments as well as any other livestock related payments.

Other Government Payments ~ Enter any other government payments, such as disaster payments, EQIP Reimbursements, CSP payments, etc.

Custom Work ~ Enter all cash farm related custom work income.

Patronage Dividends ~ Enter all **cash** patronage dividends and cash unit retains received. Additional stock accumulation should be recorded on the Balance Sheet.

Insurance Income ~ Enter the gross cash for all insurance income payments.

Cash Withdrawn from Hedging Accounts ~ Enter all cash withdrawn from hedging accounts. **See the special note on hedging transactions below.**

Other Farm Income ~ Enter all cash **farm** income not previously entered.

Special Note for EQIP and Other Cost Share Payments: It is recommended that cost-share for feedlots and other large capital purchases be entered in the following manner to minimize distortion of net farm income and enterprise profitability. Enter the total cost as a capital purchase and the cost-share portion as a capital sale. On the ending balance sheet, the cost value of the asset should reflect the total purchase amount less the government cost-share payment, less the appropriate amount of depreciation for the year. The market value should reflect the full asset value. This will balance the cash flow but will exclude the cost share payment from net farm income without distorting depreciation.

Example: If the total cost of a feedlot is \$100,000 and government cost-share is \$48,000, then \$100,000 should be entered as capital purchase (buildings and improvements) and \$48,000 as capital sale. The ending cost value of the feedlot on the balance sheet is \$49,400 ($\$100,000 \text{ minus } \$48,000 = \$52,000 * 95\%$ to depreciate over 20 years). The market value should be the estimated amount by which the addition of the feedlot increased the market value of the property on which it was built.

FARM EXPENSES:

Crop Expenses/Livestock Expenses/Related Operating Expenses ~ Enter all actual cash farm expenses paid during the calendar year.

- If an expense item is negative due to refunds, etc., submit a Unique Situation report to your database review with justification. Farms with unexplained negative whole farm expenses will be deleted from the database.
- If major unpaid resources are provided to the operation by a family member, it is recommended that a charge be included for the estimated value of those resources (hired labor, custom hire or machine lease for example) with an offsetting personal income entry to balance cash.
- If expenses were deducted from sales of grain, livestock, or livestock products, include the gross sales as income and include all expenses for trucking, commission association dues, and marketing fees here.

Specific expense categories:

- Seed treatments: include in seed expense;
- Free seed, chemicals, etc: enter as Other Farm Income and Seed/Chemical/etc. expense;
- Fertilizer and chemical application: Custom Hire;
- Employee benefits: Hired Labor;
- Silage bags: Packaging and Supplies;
- Precision farming expenses: if they do not fit elsewhere, include in Misc. Crop Expense.
- DHIA and BST: These expenses will be listed if you have downloaded the FINPACK setup files;
- Cash salaries, wages, and benefits to operators: Enter in Owner Wages and Benefits and reduce Value of Operator Labor and Management;
- Feed additives: Purchased Feed;
- Livestock implants: Veterinary;
- Manure handling: Custom Hire if hired;
- Hoof trimming – Custom Hire;
- Milk hauling – Trucking and Hauling.

Use Detail for Purchased Feed to specify the feed commodities purchased which will then contribute to the Amount Available for feed in the Livestock Enterprise Analysis.

Detail: Purchased feed

Type of Feed (Optional)	Description	Quantity	Value
Corn	Dairy	5,343 bu.	23,423
Protein Vit Minerals	Dairy	204 ton	32,256
Total			55,679

Close

Use Detail to list interest paid on individual loans. This will automatically transfer to the interest breakdown on the enterprise analysis.

Detail: Interest

Loan	Description	Amount
Accounts Payable		
Fourth National Bank	Operating	1,975
Fourth National Bank	Machinery	6,817
Fourth National Bank	Real Estate	6,866
Fourth National Bank	Cattle	1,910
John Deere Credit	Tractor	1,218
Fourth National Bank	Cows	2,122
Total		20,908

Close

Special Note for ethanol plant and other entity investments: Income from and/or expenses related to ethanol plants and other entity investments may have a significant impact in certain years. It is left to the producer/student and instructor to decide whether these

transactions result in farm (or non-farm) income. Treatment should be consistent from year to year and should be consistent with treatment of the business investment on the balance sheet. Payments received that are related to pledged bushels will usually be entered as farm income. If entered as farm income, include income tied to pledged bushels as Other Income on the Crop Enterprise Analysis. Exclude payments that reflect dividends on investment unrelated to specific bushels from the Crop Enterprise Analysis. These payments may be included in a Value Added/Non-Farm Enterprise Analysis to evaluate the profitability of these investments.

Special note on hedging transactions: If you do not have accurate record of cash deposits and withdrawals, the net cash transactions for the year can be calculated from Forms 1099: The net deposits/withdrawals = Form1099, enter Box 12 + beginning balance sheet value (Box 10) – ending balance sheet value (Box 11). If the result is positive, enter as cash withdrawn from hedging accounts and if negative, enter as hedging account deposits.

PERSONAL INCOME

Enter all cash **non-farm** income received during the analysis period.

Warning: Do not double count dividends, tax refunds that may have been **farm** income such as gas tax refunds, property tax refunds, etc.

OTHER INFORMATION

Gifts and Inheritances ~ Enter cash gifts and cash inheritances received. For non-cash items, enter the value as a capital purchase and offset the purchase by also entering the value here.

Family Living Expense ~ Enter cash family living expenses including personal share of utilities, insurance, property taxes, and any other such expense. The total expenditure should be tracked for each operation, whether or not detailed family living expenditures are recorded. If Detailed family living expenses are entered, be sure to enter the number of family members. Enter owner wages as farm expenses, not owner withdrawals. **For partnerships, use detailed family expenses or enter total under partnership withdrawals detail item, not both.**

Income and Social Security Tax Paid ~ Enter all cash income and personal self employment taxes paid during the calendar year.

Cash Gifts Given ~ Enter all cash gifts given.

Estimated Value of Labor and Management ~ This is the opportunity cost charged for unpaid operator labor and management when calculating the Rate of Return on Assets and Rate of Return on Equity. It is also combined with any Owner Wages and Benefits expense and deducted from the enterprise analysis reports. In the RankEm Summary reports it is always combined with Owner Wages and Benefits to make farms of different ownership

structure comparable. For sole proprietors and partnerships, the recommended rate for 2016 is: \$25,000/full time operator plus 5% of value of farm production. This is a guideline only; adjust for very small or very large farms. Other adjustments:

- For entities, if owner compensation is included in Owner Wages and Benefits expense, enter zero OR, if the amount included is abnormally low or high, make an adjusting entry here to bring the total value of Owner Labor and Management in line with other farms.
- For sole proprietors and partnerships, if any compensation is included in Owner Wages and Benefits, reduce Value of Labor and Management by the same amount.
- Wages paid to children and other family members (other than operators and their spouses) who have no at risk capital investment and do not share in profits should be included as hired labor expense and have no effect on this entry.

CASH FLOW CHECK

At any time during data entry, click the check-mark icon  on the toolbar to view the cash flow check.

	Amount		Amount
Beginning cash balance	1,254	Ending cash balance	3,624
Gross cash farm income	272,271	Total cash farm expenses	202,056
Personal income	17,158	Owner withdrawals for family living	47,787
Capital sales		Capital purchases	12,500
Money borrowed	85,888	Principal payments	104,437
Gifts and inheritances		Gifts given	
Beginning personal savings	1,634	Ending personal savings	1,634
		Income taxes	8,557
Total inflows	378,205	Total outflows	380,594
		Discrepancy	-2,389

LABOR HOURS

Use labor records or estimate the total hours of labor employed by the farm for the year. Hours of labor guideline for unpaid operator and family labor:

Operator:

Crop Farm Only	=	1,500 Hours
Diversified Crop/Livestock	=	2,500 Hours
Intensive Livestock	=	3,000 Hours
(These are guidelines, adjust to fit the operation.)		

Make adjustments for part time situations and as needed. Remember to include the spouse and other family members. For entities, if *Owner Wages and Benefits* expense is included, include owner/operator hours in *Full Time Hired Labor*. (This input is critical to the hours of work listed on the analysis in each individual enterprise.)

ACCRUAL ADJUSTMENTS TO RELATED OPERATING EXPENSES

This section makes adjustments to the cash expenses to arrive at the amount actually incurred for the analysis year. Recommendation: Enter the detailed expense categories for prepaid expenses, growing crops, accounts payable and accrued interest on the balance sheets to automatically complete this page.

FARM INTEREST BREAKDOWN - Enter interest accrued during the calendar year. When detail is used for farm interest expense input, the amounts automatically move to this location, therefore, you do not have to input them here. For sugar beet stock loans, see sugar beet section.

Cash Interest Paid + Ending Accrued Interest - Beginning Accrued Interest = Interest on Debt. Interest on Debt needs to be allocated to operating, intermediate and long term.

RELATED OPERATING EXPENSE ALLOCATIONS

Enter the proportion of the total for each allocated expense to crop, livestock, and other (value added/non-farm) enterprises. Toggle  to enter dollars instead of percentages.

Note: To maintain meaningful trends, attempt to be consistent from year to year unless there are major changes to the farming operation. The average for power and machinery is 75% - 80% to crops, for building and fences is 30% - 35% crops.

CROP SHARE RENTAL ARRANGEMENTS – Select whether the operation being analyzed is the Renter or Landlord. Then enter their share of the production and expenses.

Note for Zero Cash Rental Arrangements

If a producer rents land for zero cash rent, enter as a 100% share arrangement with the renter also paying 100% of all expenses.

CROP ENTERPRISE ANALYSIS

Crop Name ~ Use the crop list (“Down arrow” Pick List). If you want to use a crop that is not listed, contact a member of the database review team from your area. User added crops, those that are not in the FINPACK master list, will not be included in summary reports.

- For hay crops, recommended enterprises are:
 - Alfalfa hay
 - Clover hay
 - Mixed hay
 - Grass hay
 - Small grain hay
- For haylage and other wet forages other than corn silage, it is recommended but not required that the dry hay crop name be used and the forage production be converted using the formula under Total Production.
- Organic transition crops should be listed using the conventional crop name until they reach organic certification.

Description ~ You may use this to further describe the crop or field. Be consistent. This description can be used to select specific fields in historical database reports. For “small grain hay” use the description to identify barley, oats, and mixed.

Crop Type ~ Use only if applicable. The default is normal crop.

- Hay establishment should be entered separately from full production hay and coded establishment. If seeded with a cover crop such as oats, enter the alfalfa in a separate column from the cover crop and code it establishment/double crop. (The cover crop should be left as Normal). Use your judgment in allocating seed, fertilizer and other direct expenses between the enterprises. Overhead allocations should reflect the total effort or use of equipment for the two enterprises. A suggested approach is to enter a minimum of 2/3 of the normal allocation to the cover crop and 1/2 of the normal allocation for the hay crop. For example, if the normal allocation factors are 30 for oats and 60 for alfalfa, enter 20 for the oats enterprise and 30 for alfalfa establishment. Fixed per acre allocation items, such as real estate taxes, should be reduced to total 1 across the enterprises.
- Be sure to code irrigated crops – they should not be summarized with dryland acres.

Acres Owned ~ Either total crop or each field owned. Custom hire enterprise acres should be entered as Acres Owned. Custom hire enterprise acres are excluded from Total Crop Acres.

Acres Cash Rented ~ Either total crop or each field cash rented.

Acres Share Rented ~ Either total crop or each field share rented.

Your Share ~ Must choose a % production from the above crop share rental arrangements. (100% if owned or cash rent.)

Total Production ~ Bu, Cwt, Tons and total volume produced for this field or crop (your share). Use the FINPACK unit whenever possible.

- Convert haylage to dry hay equivalents using the following formula
 - $(\% \text{ dry matter of wet crop} \div \% \text{ dry matter of hay equivalent}) * \text{wet production}$
 - Example for converting 100 tons of haylage:
 $(.50 \text{ dry matter haylage} \div .85 \text{ dry matter hay}) * 100 = 58.8 \text{ tons}$
- Convert high moisture corn to dry corn equivalent.
- For CRP, Custom Work, Prevented Planting, and Rented Out, enter the dollars received as the production and \$1.00 for the Value Per Unit. Enter the income received for Prevented Planting as Production, not as Crop Insurance Income. If forage or another product was harvested from Prevented Planting acres, include it as a secondary product or Other Income in the Prevented Planting enterprise.
- For pasture, estimate production in AUMs based on these animal units:

<i>1000 lb. Cow/calf</i>	<i>1.00</i>
<i>1100 lb. Cow/calf</i>	<i>1.07</i>
<i>1200 lb. Cow/calf</i>	<i>1.13</i>
<i>Mature bull</i>	<i>1.30</i>
<i>Calves by themselves</i>	<i>0.30</i>
<i>Weaned calves to yearling</i>	<i>0.60</i>
<i>Yearling cattle (600-800 lbs)</i>	<i>0.75</i>
<i>2-year old cattle</i>	<i>0.85</i>
<i>Dairy cow</i>	<i>1.30</i>
<i>Ewe/lamb pair</i>	<i>0.20</i>
<i>Mature horse</i>	<i>1.50</i>

For example, if a pasture enterprise fed one hundred 1100 pound beef cows for six months, enter 642 aums (100 cows x 1.07 animal units x six months). This same amount should be entered as a feed expense to the beef enterprise analysis.

Value Per Unit ~ For crops already sold or contracted for sale, enter the actual sale/contract price. For crops in inventory, use the ending inventory value with a minimum of the loan rate for program crops. For crops already fed, use a conservative sales value and use this same value for valuing the feed in the Livestock Enterprise Analysis. Forage values should reflect relative feed value (RFV) and be based on estimated sales value, not purchase prices. Stearns DHIA Laboratories provides actual auction prices based on RFV at: <http://www.stearnsdhiab.com/Auct-Hay.htm>.

Other Income ~ Allocate hedging gains or losses, crop insurance income, LDP payments for this year's production, crop government payments (ARC and PLC), and any other crop related income. Examples are straw sales, crop specific disaster payments, and hauling allowance. Enter **Detail** to document what was included. Use the -X method to allocate across like enterprises (see Direct Expenses below).

Special notes:

- Because of the uncertainty of ARC and PLC payments, Crop Government Payments should be allocated to the year received rather than the production year.
- *Allocation of Government Payments:* ARC and PLC payments are entered here but are included in the output report as a "below the line" adjustment, meaning they are added to the net return at the bottom of the output report. It is recommended that payments be allocated over all tillable acres, except crops that did not contribute to base such as edible beans, carrots, potatoes, or other vegetable crops. Allocate by farm unit if possible.
- CSP payments: Because these are often very large payments that may impact a limited number of acres, including these payments in enterprise income will often distort enterprise returns. Therefore, if you choose to include these payments, please mark impacted enterprises to be excluded from the database.

Direct Crop Expenses ~ Enter the amount for each crop in dollars. For like enterprises, enter the total cost in one column. You can then assign it equally to the other fields using a "-X" in the other enterprise(s), where X refers to the column in which the total was entered. For example, enter the first corn enterprise in column number 2. Enter the total seed cost for all corn in this column. For each succeeding corn enterprise, enter -2 for the seed expenses to distribute the total equally (per acre) to all corn enterprises. (Crops do not have to be listed side-by-side for this to function properly.)

Seed ~ Seed expense (may include seed treatment). Assign a realistic expense for home-grown seed used. (Usually market price, plus cleaning treating and hauling). For canning crop enterprises, particularly peas and sweet corn, if the producer actually paid the seed expense, enter zero seed expense and reduce the Value per Unit to decrease gross return by the amount of the seed cost.

For hays, seed expenses should appear only on establishment enterprises and not on the full production enterprises unless there were re-establishment costs. If re-establishment occurred, make a note in the FINAN for reviewers.

Fertilizer ~ Fertilizer or purchased manure. If custom applied, include product cost only and include application expense in custom hire.

- **Corn fertilizer allocation to soybeans:** If no fertilizer was applied to soybeans, but fertilizer was applied to corn to supply nutrients for next year's soybean, a portion of the corn fertilizer should be allocated to soybeans. The recommended

allocation is 50% of the corn P & K expense OR 25% of total corn fertilizer expense if P&K cannot be broken out.

- **Prevented planting:** Acceptable approaches for fertilizer applied to Prevented Planting acres: 1) If the producer plans to reduce phosphorus and potash applications in the following year to use up these nutrients, accumulate these amounts in prepaid expense on the ending balance sheet to be allocated in the following year's analysis; 2) if not, charge all fertilizer applied to prevent plant acres to the Prevented Planting crop.

Crop Chemicals ~ Chemical expenses. If custom applied, include product cost only and include application expense in custom hire.

Crop Insurance ~ Hail and other crop insurance. Include gross premium, with any income listed as "Crop insurance income."

Drying Fuel ~ Amount of drying fuel for the crop.

Custom Hire ~ Fertilizer, chemicals, aerial application, and freight charges for sugar beets.

Hired Labor ~ Special hired labor usually limited to sugar beets and potatoes.

Land Rent ~ Cash rent amount total for this crop or field.

Machinery leases ~ True leases specific to this crop or field.

Marketing ~ Commodity marketing consultants, hedge or option expense, sugar beet joint ventures contract. (See sugar beet stock page for owned stock).

Allocated Crop Expenses ~ Enter allocation factors that weight the expense portion allocated to each crop on a per acre basis. Toggle  to view in Dollars but entries must be made as allocation factors.

Default Allocation ~ This allocation will be used for any expense that has no entry below. The Standard Allocations will automatically appear when the crop is selected. Adjustments can be made to any individual line, however.

Other Crop Information ~ This information will be used to provide additional detail in the state database.

Previous Crop ~ If the entire field was planted to the same crop in the previous year, enter the crop from the drop-down list.

Field County ~ The county will default to the county entered on the Summary Information page. Change if this field is in a different county.

Production Practices ~ Tillage method, row spacing, other production practices if consistent practices were employed across the entire field. If inconsistent practices were used, leave that practice blank. Note: It is just as important to specify that a specific practice was not used. For example, if no Genetic Chemical Resistant seed was used, be sure to select No.

Special Sorts ~ Use the special sorts where appropriate. Joint venture is a must for rented Beet Stock acres.

Delete from Summary ~ Use to delete an individual enterprise only. The rest of the “Whole Farm” and Enterprise Information will be included in the summary. Do not delete because of a disaster or loss. **If you have any concern about the accuracy of the data, delete it from the averages. If the whole field or a major portion was replanted, delete from the averages.**

Special note on cover crop expenses: Expenses related to planting cover crops for soil and nutrient enhancement should be captured to the balance sheet and allocated to the following year’s crops. The recommended approach is to list these expenses in Growing Crops on the balance sheet. Then, the following year, reduce the growing crop asset as those expenses are allocated to the crops that followed the cover crop. The growing crop asset can be allocated over more than one crop year if desired.

LIVESTOCK ENTERPRISE ANALYSIS

Livestock Enterprise ~ Use the “drop-down” livestock list. The livestock list to use is also listed at the end of this section. If you want to use a livestock enterprise that is not listed, please call a member of the database review team for your area. Be sure to use the proper enterprise.

- If beef calves are carried beyond weaning they should be transferred to a backgrounding enterprise to keep the state data accurate. If backgrounders are included in the cow-calf enterprise, use the “Cow-calf with backgrounding” special sort.
- The dairy enterprise **must** be split between dairy and dairy replacements. The table below displays how dairy replacements should be included depending on whether the farm being analyzed is the dairy producer or the heifer raiser. Calves should be born in the dairy enterprise and transferred out to the dairy replacement and/or dairy steer enterprises.

Activity	Dairy Producer	Heifer Raiser
Raised replacements	Dairy replacements With raised repl sp sort	
Buy / sell	Dairy replacements With buy/sell sp sort Avg head includes farmed out	Dairy repl for sale With buy sell special sort
Per head per day	Dairy replacement With perhead/perday sort Contract raising cost goes here	Dairy repl for sale With special sort

Description ~ Be consistent with input in this cell. This description can be used in the Historic Database to generate trend reports for specific herds or lots of animals.

Gender ~ This is only active for grow/finish enterprises. Use to specify male or female only enterprises. Leave this entry blank for mixed gender enterprises.

Contract ~ Use to specify that this enterprise is produced under a production contract. Contractor is the owner of the livestock. Contract Grower is the producer who is housing livestock for the owner. Leave this entry blank for enterprises that are not produced under a production contract.

Shared ~ Select Yes if this enterprise is produced on a share rental basis.

Combine with Enterprise Number ~ Use to combine the lesser enterprise with the primary enterprise. (Ex: If the Dairy Cow Enterprise is in Column 1 and the Dairy Replacements are in Column 2, enter the number “1” in this cell in the Dairy Replacement Enterprise Column.)

Special Sorts ~ Use appropriate Sorts as identified in Section V. of this Closeout Manual. Be sure to use for Organic enterprises and Dairy Initiatives farms.

Delete from Summary ~ Use to delete an individual enterprise only. The rest of the “Whole Farm” & Enterprise Information will be included in the summary. Do not delete simply because of a disaster, disease, etc.

Inventory ~ If detail is listed on the Balance Sheet, you can bring the information into the Livestock Inventory Section. To do so, first click the Detail button. Then click the Select icon from the detail toolbar  and check the animals that belong to this enterprise (see below).

Include	Description	Number	Total Weight	Total Value
<input checked="" type="checkbox"/>	Dairy cows	55		44,000
<input type="checkbox"/>	Bred heifers	11		6,600
<input type="checkbox"/>	Yearling heifers	15		6,000
<input type="checkbox"/>	Heifer calves	14		2,800
<input type="checkbox"/>	Sows	32		3,200
<input type="checkbox"/>	Gilts	9		900
<input type="checkbox"/>	Boars	2		684

Note: You can also Select  from previous entries for feeder livestock purchases (from whole farm detail), sales and cull sales (from whole farm detail on the Other Farm Income page).

Born ~ For pig production enterprises, enter the number born alive. All dairy calves are born into the dairy enterprise. Those sold as calves should be sold from the dairy enterprise. All others are transferred out and into the Dairy Replacement or Dairy Steer enterprise at market value (suggested price \$100.00/head).

Sold ~ The recommended conversion for pigs sold on a carcass weight basis is to convert to live weight based on a 75% yield if actual yield is unavailable.

Cull sales ~ Downers should be included with culls, not died.

Transferred Out ~ Beef; Calves to Feeders; Dairy heifer calves from Cows to Dairy Replacements; Dairy bull calves to Dairy Steers if not sold directly from dairy enterprise; Hogs - transferred to Breeding when farrowed - transferred out at weaning from Farrowing to Finishing if Finishing is separate.

- Note: When transferring calves from a Cow-Calf Enterprise to a Beef Background or Beef Feeder Enterprise, charge 3% shrink value to the Cow-Calf Enterprise. This is done by reducing the transfer out value by 3%. This shrink cost will help the retained ownership enterprises reflect a more current analysis.

TRANSFER TABLE

Enterprise Description	Number	Pounds	Value
Beginning and Ending Inventory - Breeding Livestock	Cows on hand Bulls Bred Heifers Open Heifers kept for Breeding	Exclude for Dairy, Beef, and Sheep breeding stock.	Cost value for breeding; Market Value on market livestock
Beginning and Ending Inventory - Held for Sale	All except breeding stock	Total weight (exclude for dairy)	Market Value
Born	Born to dairy Transferred out to Replacement Dairy		
Purchased	Number of Head	Exclude for Dairy, Beef, and Sheep breeding stock.	What you paid
Transferred in (Once a cow, always a cow; Calves get born into dairy cow & transferred out)	Head Amount	Exclude for Dairy, Beef, and Sheep breeding stock.	Breeding stock at cost; otherwise Market Value
Sales (except Culls)	Number of Head including sales for breeding stock	Weight (except dairy)	Cash Receipts
Culls	Cull cows, dairy, beef, hogs, etc.	Exclude for Dairy, Beef, and Sheep breeding stock.	Cash Receipts
Butchered	X	X	X
Died – Breeding Stock	(Same as Beginning Inventory – Breeding Livestock)		
Died – Held for Sale	(Same as Beginning Inventory - Held for Sale)		

LIVESTOCK PRODUCTS AND OTHER INCOME

Milk ~ The quantity and value should be the milk produced during the analysis year. Use Detail and then the Select icon  to select from whole farm entries.

Fed ~ Milk fed to calves

Other Income – Include dairy MPP or other government payments and hedging gain or loss (enter negative). For Breeding Bulls (leased out) - split out as a separate enterprise and show lease income. Use Detail to document entries.

Livestock Product Sales	Quantity	Value
Milk	Pounds	\$
Wool	Pounds	\$
Honey	Pounds	\$
Eggs	Dozen	\$

OTHER INFORMATION

Dairy ~ Required fields are Average Number of Cows and Barn Capacity. All other entries are optional for but will be included in the Historical Database and RankEm.

Hogs ~ Live to carcass weight conversion factor will default to 75% if left blank.

Grow/Finish Enterprises ~ Average “daily” Number of Head and Normal Gain per Head are required if listed. Other information should be taken from livestock inventory matrix. Normal Gain per Head is divided into the total enterprise gain to arrive at the number of head “equivalents” produced for the year. This becomes the divisor for the Per Head output column.

FEED FED

Enter the quantity and value of each feed fed. Toggle  to enter price per unit instead of total value.

- Enter haylage and other wet forages in “as fed” form or enter the dry forage name and convert to dry equivalent at your discretion. If haylage is converted to dry hay, use the following formula:
 - $(\% \text{ dry matter of wet crop} \div \% \text{ dry matter of hay equivalent}) * \text{wet production}$
 - Example for converting 100 tons of haylage:
 $(.50 \text{ dry matter haylage} \div .85 \text{ dry matter hay}) * 100 = 58.8 \text{ tons}$
- Convert high moisture corn to dry corn equivalent.
- See the discussion of AUMs under Crop Enterprise Analysis for pasture. Use the same value per unit for production of AUMs and feeding of AUMs.
- Milk replacer should be included in the Dairy Replacement enterprise and not in Dairy.

Feed	Unit
Beet pulp	Ton
Complete ration	Ton
Corn gluten	Ton
Cottonseed	Ton
Creep/starter	Ton
DDGS, dry	Ton
DDGS, wet	Ton
Midds	Ton
Milk	Lbs.
Milk replacer	Lbs.
Pasture	AUMs
Protein, vitamins and minerals	Ton
Stover	Ton
Straw	Ton
Whey	Ton

DIRECT LIVESTOCK EXPENSES

Enter total dollar amount of each expense listed.

- Note the DHIA costs of a Dairy Cow enterprise should be entered separately.
- Silage bags should be included in “livestock supplies” unless the intent is sale, in which case they should be included in “miscellaneous crop expense.”
- Marketing expenses include only costs incurred in marketing and marketing decisions such as brokerage fees, advertising, state and national deductions, and use of marketing tools. Include selling expenses, check-offs, insurance, shrink, etc., but not hauling. Do not include gains and losses from hedging/options; these should be added to or subtracted from “Other Income (enter a negative if necessary).”
- Hauling and pickup charges need to be entered as “hauling & trucking.”
- Recommended allocation of manure application costs:
 - Dairy – 2/3 to livestock, remainder to crops
 - Hogs – 2/3 to crops, remainder to livestock

ALLOCATED LIVESTOCK EXPENSES

The top of the page will indicate whether you are entering Percentages or per head Allocation Factors. Allocation factors can be turned on and off under Tools. For Percentages, enter the % of the total of each expense listed. For Allocation Factors, the entries will be weighted by the number of head in the enterprise.

Default Allocations ~ This allocation will be used for any expense that has no entry below. They will appear automatically when the Standard Allocations are used.

Special notes for Dairy

- List all heifers as breeding stock.
- Cull cows will remain in the breeding herd category.
- Calves are born in the primary dairy enterprise. Those sold are sold directly from the dairy herd. All others are transferred, females to dairy replacements, males to dairy steers at market value (suggested value \$100.00/head).

VALUE ADDED/NONFARM ENTERPRISES

Use the Value Added/Nonfarm Enterprise Analysis to analyze value added co-op investments, custom work, and nonfarm enterprises such as trucking and seed sales.

Enterprise ~ Select the enterprise type from the drop down list. This will only be used to sort enterprises for group summaries.

Divisor quantity and description ~ If it is useful, use this as a custom divisor for the output report. Do not use for crop or livestock units used in the enterprise – this will be included under the crop and livestock entries. The divisor description will be used in the column heading. Examples, miles for trucking, shares for co-op investments.

Crop Related Enterprises ~ If you want to analyze this enterprise based on the number of units of a crop used, enter the crop name and the number of units used/marketed. Also, if the easiest way to measure the income from this enterprise is to calculate the premium price received for the crop, enter the Total Premium income received over the price used to value the crop in the crop enterprise analysis.

Livestock Related Enterprises ~ If you want to analyze this enterprise based on the number of units of a livestock enterprise used, enter the enterprise name and the number of units used/marketed. Also, if the easiest way to measure the income from this enterprise is to calculate the premium price received for the livestock, enter the Total Premium income received over the price entered for sales of from this enterprise in the livestock enterprise analysis.

Dividends and Direct Income ~ Enter any other income for the enterprise. All income for the enterprise must be entered in Crop Premium, Livestock Premium, Dividends, and Direct Income.

Cost of Goods Sold ~ Optional, use this only if the enterprise has an identifiable cost of goods sold as would be entered on Schedule C for this enterprise.

Total Investment ~ This will be used to calculate the Rate of Return on Assets for this enterprise.

Direct Expense ~ This is the IRS Schedule C expense list. Enter all expenses except the cost of goods sold and those allocated from the farm expenses.

Allocated Expenses ~ Enter the percentage of the Value Added/Nonfarm allocated expenses to each enterprise.

V.

*Organic &
Specialty Crop
Farm Analysis*

Whole Farm Special Sorts Analysis

If all enterprises produced on the farm are certified organic, identify the producer as Organic Farm (total) in the Whole Farm Special Sorts. If some but not all enterprises are certified organic, identify the farm as Organic Farm (partial).

If the farm produces fruits or vegetables for fresh markets, identify the producer as a Specialty Crop Farm. Special emphasis should be placed on producers of fresh market apples, berries, grapes, mixed vegetables, pumpkins, and sweet corn.

Balance Sheet

For producers who are establishing new orchards or perennial crops, accumulate the costs of establishment in Other Intermediate Assets and depreciate over a conservative economic life of the plants.

Crop Enterprise Analysis

Enterprise Identification (Organic): Specific organic identifiers exist for the following crops:

Barley	Hay, alfalfa	Peas
Buckwheat	Hay, grass	Rye
Corn	Hay, mixed	Sorghum silage
Corn, blue	Oatlage	Soybeans
Corn silage	Oats	Sunflowers
Flax	Pasture	Wheat, spring

Enterprise Identification (Specialty Crops)

- Vegetables (assorted): Use this crop for multiple products produced on a small acreage, making it impractical to analyze each enterprise individually. Enter the value of the total production of these crops as the Production.
- Vegetables (high tunnel): Use this crop for vegetables produced in high tunnel facilities, again entering the total value of production as the Production.

Production: If multiple products are produced from the same acreage, follow these guidelines:

- If the multiple products result from harvesting the same product in different forms, use detail for Total Production to identify the production of each product. This would be common for taking hay and pasture from the same acreage.
- If different products are produced under two separate production activities, enter the activities as separate enterprises and identify the second, third... enterprises as double crops.
- If some crop was left in the field because of lack of markets, report the quantity sold.

Direct Expenses:

- Organic weed, insect, or other pest control – Non-Chemical Crop Protection;
- Certification expenses – Organic Certification
- Fallow – Direct expenses incurred on fallow land should be included in whole farm expenses but should be captured and included as Growing Crop expenses on the ending balance sheet. These Growing Crop expenses should then be assigned to the production crops in the following year. Fallow enterprises should be entered to account for the acres but direct expenses should be handled as stated and overhead expenses should be allocated to production crops.

Overhead Expense Allocations: If organic and conventional production occurred on the same farm, use your and your student's knowledge of the production system to allocate overhead expenses to the various enterprises.

Livestock Enterprise Analysis

Enterprise Identification: Identify enterprises as Organic using the Special Sorts.

Feed Fed: Home produced organic feed should be valued at estimated market value for organic feed of the same quality.

Direct Expenses:

- Certification – Organic Certification

VI.

*Downloading
FINPACK
Setup Files*

DOWNLOADING FINPACK SETUP

Download the FINPACK setup for your region by:

1. Go to: <http://www.cfm.umn.edu/>
1. Select Publications + Educator FINPACK Setups
2. Click **Start Download**
4. Save FPUiformSetup.exe to your computer and run it
5. Select your group from the State/Region drop-down list
6. Follow the steps to finish the setup installation

VII.

Importing
FINAN Data

IMPORTING FINAN DATA

EXPORTING FROM ACCOUNTING SOFTWARE

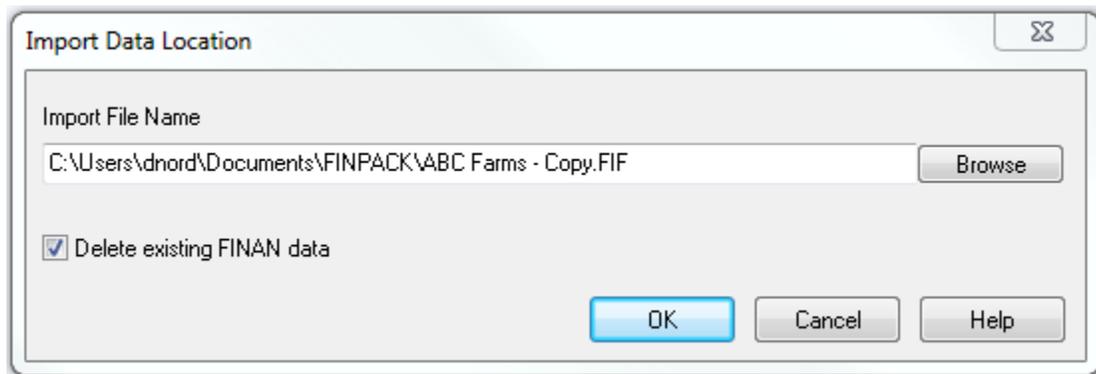

FINPACK interfaces exist for several accounting software packages including QuickBooks, Quicken, EasyFarm, PCMars, UltraFarm, and MicroTel. Each system will export the cash transactions for the period in a file format that can be imported into FINAN. At this time, only cash transactions are included. Most systems export totals for each chart of accounts category.

The exported file will have a file extension of '.fif' (FINPACK Interface File). If the export file does not include this extension, rename the file to add the .fif extension. Refer to the individual accounting system documentation for instructions on exporting data for FINPACK.

SELECTIN THE FINPACK INTERFACE FILE

Begin by creating your FINAN for the accounting period, either by creating a blank FINAN or copying last year's analysis. On the FINAN General Information page, select the beginning and ending balance sheets (balance sheet data is not imported). Then select Edit + Import Data from the main menu.

You will be prompted for the file location. If the correct file name for this farm is not displayed, click Browse to find the correct file.

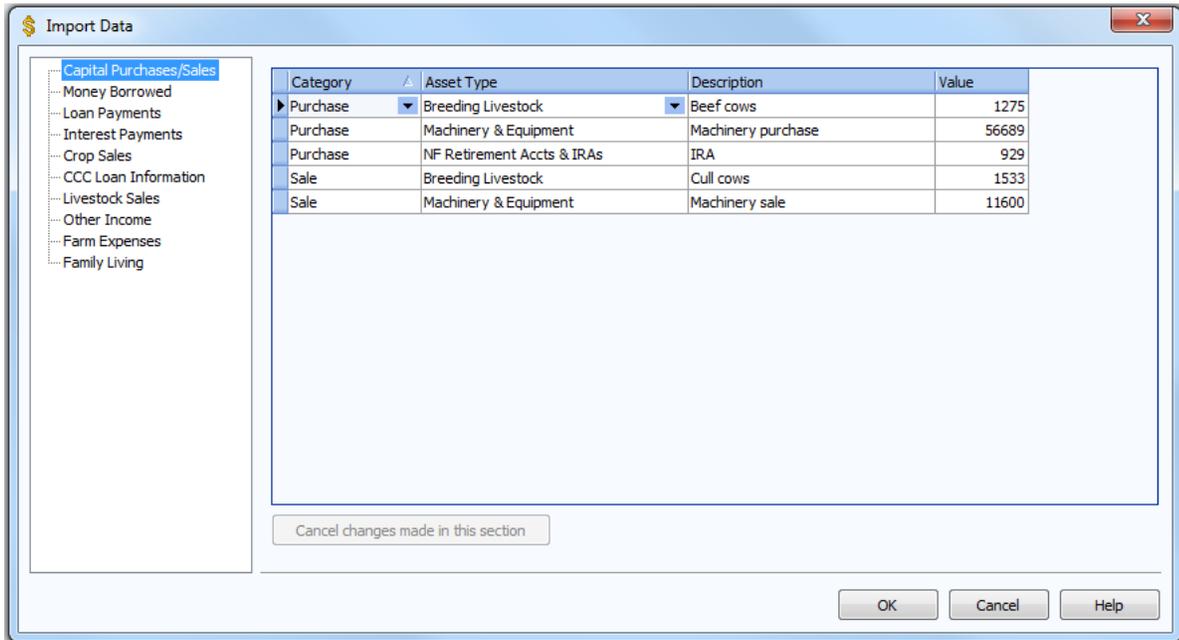

The default setting is to delete all existing cash transaction data from the FINAN input. If you uncheck this option, imported transactions will be added to existing transactions. This may be useful for farms that keep more than one set of accounts.

CHECKING AND CORRECTING CHART OF ACCOUNTS MAPPING

When the FINPACK Interface File is selected, the data will be displayed by category and chart of accounts location as shown below. At this point you have the ability to check and

edit the destination of the imported data in FINAN. Scroll through the FINAN data entry page titles on the left to review and edit the data mapping.

Column 1: Category – This is the FINAN Whole Farm data entry category destination for the transaction data. The category can be changed to move data to a different location in FINAN. If the new category moves the data to a different page, the record will disappear from the current category listing once you move to a different record (as it is moved to the new page).

Column 2: This is the chart of accounts destination for each transaction. The major purpose of this page is to allow you to change the destination to accurately import the transaction data into FINAN.

Column 3: Description – This is the description of the account from the accounting software.

Column 4: Value – This is the dollar amount that will be imported. Values can be changed here in the unusual situation that a correction is needed. Value changes are temporary until the data is imported or the import is Cancelled; changes are not saved in the ‘.fif’ file.

When you have verified the data mapping for each page of FINAN data entry, click OK. When the data has been successfully imported, the FINAN will close and you will need to re-open it to view and edit the FINAN data.

IMPORTING ERRORS

If errors are found in the import file, an error message will be displayed and specific amounts will not be imported. Errors usually indicate that the chart of account being

mapped to in FINAN is not active in your copy of FINPACK. You will have to manually enter these amounts in FINAN to correct the problem.
